

## GIS & FMIS Technology For Diocesan & Parish Planning & Operations

### Parish Analysis and Planning

- » Parish boundary and facility mapping
- » Parishioner mapping
- » Thematic displays of demographic data and trends

### School Analysis and Mapping

- » School location mapping— parochial, public, private
- » Student location mapping
- » Drive time characteristics
- » Population/demographic/income trends

### Real Property Asset Inventory and Facility Management

- » Research and mapping of diocesan real property buildings
- » Valuation and report generation
- » Space management
- » Energy monitoring
- » Indoor environmental monitoring
- » Site management
- » LEED® certification

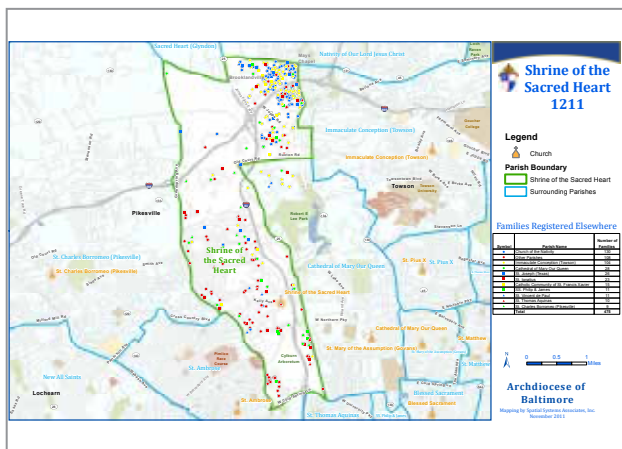

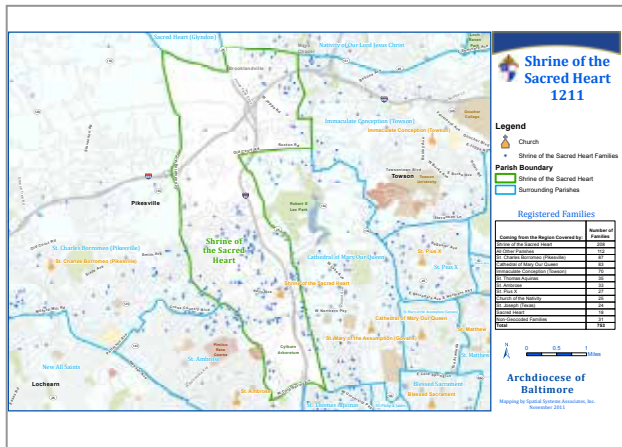

### Cemetery Management

- » Plot availability
- » Records management
- » Parish legacy

### Analyses

- » As needed analysis and report generating, using GIS technologies—i.e.  
     Parish/school viability  
     Marketing for students

### Web Services

[illegible]

The use of computerized analytical tools to evaluate trends in changing demographics, populations, and household income characteristics, combined with the ability to present the results of these trends cartographically both to diocesan and parish planning groups, facilitates the planning process.

- » The location of official parish boundaries.
- » The location of church, school, and parish related facilities.
- » The location from which registered parishioners travel to church.
- » A depiction of, within the boundaries of the parish, the locations of families who are registered to a parish other than the “home” parish, and an analysis of the number of families registered to each “competing” parish in comparison to the number of families registered to the “home” parish.
- » Thematic displays of population trends, demographics, and household income characteristics in the region from which the parish draws its parishioners.
